# Variables 

Module 2

Andrew Jaffe
June 15, 2015

## Getting Started

- You should have the latest version of $R$ installed ( R 3.2 .0 as of $6 / 15 / 2015$ )!
- Open R Studio
- Files $->$ New $->$ R Script
- Save the blank R script as "day1.R" in a directory of your choosing
- Add a comment header

## Commenting in Scripts

Add a comment header to day1.R :\# is the comment symbol

```
#################
# Title: Demo R Script
# Author: Andrew Jaffe
# Date: 6/15/2015
# Purpose: Demonstrate comments in R
###################
# nothing to its right is evaluated
# this # is still a comment
### you can use many #'s as you want
# sometimes you have a really long comment,
# like explaining what you are doing
# for a step in analysis.
# Take it to another line
```

## Explaining output on slides

In slides, a command (we'll also call them code or a code chunk) will look like this

```
print("I'm code")
## [1] "I'm code"
```

And then directly after it, will be the output of the code.
So print("I'm code") is the code chunk and [1] "I'm code" is the output.

## $R$ as a calculator

```
2+2
```

\#\# [1] 4
$2 * 4$
\#\# [1] 8
$2 \sim 3$
\#\# [1] 8

Note, when you type your command, R inherently thinks you want to print the result.

## R as a calculator

- The R console is a full calculator
- Try to play around with it:
,,$-+- /, *$ are add, subtract, divide and multiply
$-^{\wedge}$ or ${ }^{* *}$ is power
- parentheses - ( and ) - work with order of operations

## $R$ as a calculator

```
2+(2*3)^2
```

\#\# [1] 38
$(1+3) / 2+45$
\#\# [1] 47

## $R$ as a calculator

Try evaluating the following:

- $2+2 * 3 / 4-3$
- 2 * $3 / 4$ * 2
- 2^4-1
- You can create variables from within the R environment and from files on your computer
- R uses "=" or "<-" to assign values to a variable name
- Variable names are case-sensitive, i.e. X and x are different

```
x = 2 # Same as: x <- 2
x
## [1] 2
x * 4
## [1] 8
x + 2
## [1] 4
```

## R variables

- The most comfortable and familiar class/data type for many of you will be data.frame
- You can think of these as essentially Excel spreadsheets with rows (usually subjects or observations) and columns (usually variables)
- Go to RStudio $->$ Tools $->$ Import Dataset $->$ From Web URL then paste
http://www.aejaffe.com/summerR_2015/data/Charm_City_Circulator_Ridership.csv

## $\mathbf{R}$ variables

- We can display the top of the data with head:

```
head(Charm_City_Circulator_Ridership)
```

|  |  | orangeBoardings |  |  |

## R variables

- data.frames are somewhat advanced objects in R ; we will start with simpler objects;
- Here we introduce " 1 dimensional" classes; these are often referred to as 'vectors'
- Vectors can have multiple sets of observations, but each observation has to be the same class.

```
class(x)
```

\#\# [1] "numeric"
y = "hello world!"
print(y)
\#\# [1] "hello world!"
class (y)
\#\# [1] "character"

## $R$ variables

Try assigning your full name to an R variable called name

## $R$ variables

Try assigning your full name to an $R$ variable called name

```
name = "Andrew Jaffe"
name
```

\#\# [1] "Andrew Jaffe"

## The 'combine' function

The function $c()$ collects/combines/joins single R objects into a vector of R objects. It is mostly used for creating vectors of numbers, character strings, and other data types.

```
x <- c(1, 4, 6, 8)
X
```

\#\# [1] 1448
class ( x )
\#\# [1] "numeric"

## The 'combine' function

Try assigning your first and last name as 2 separate character strings into a single vector called name 2

## The 'combine' function

Try assigning your first and last name as 2 separate character strings into a length- 2 vector called name 2

```
name2 = c("Andrew","Jaffe")
name2
```

\#\# [1] "Andrew" "Jaffe"

## $\mathbf{R}$ variables

length(): Get or set the length of vectors (including lists) and factors, and of any other R object for which a method has been defined.

```
length(x)
## [1] 4
y
## [1] "hello world!"
length(y)
## [1] 1
```

## $R$ variables

What do you expect for the length of the name variable? What about the name 2 variable?
What are the lengths of each?

## $R$ variables

What do you expect for the length of the name variable? What about the name 2 variable?
What are the lengths of each?

```
length(name)
## [1] 1
length(name2)
## [1] 2
```

## $R$ variables

You can perform functions to entire vectors of numbers very easily.
$x+2$
\#\# [1] $3 \quad 6 \quad 810$
x * 3
\#\# [1] 31218124
$\mathrm{x}+\mathrm{c}(1,2,3,4)$
\#\# [1] $2 \begin{array}{llll}6 & 6 & 12\end{array}$

## R variables

But things like algebra can only be performed on numbers.

```
> name2 + 4
[1] Error in name2 * 4 : non-numeric argument
to binary operator
```

## R variables

And save these modified vectors as a new vector.

```
y = x + c(1, 2, 3,4)
```

y
\#\# [1] $2 \begin{array}{llll}6 & 6 & 12\end{array}$

Note that the R object y is no longer "Hello World!" - It has effectively been overwritten by assigning new data to the variable

## $R$ variables

- You can get more attributes than just class. The function str gives you the structure of the object.

```
str(x)
## num [1:4] 1 4 6 8
str(y)
## num [1:4] 2 6 9 12
```

This tells you that x is a numeric vector and tells you the length.

## Basic Summarization

Here are some simple functions for making calculations on data.
sum (): takes the sum of all numeric variables in a vector
mean(): takes the mean of all numeric variables in a vector
median(): takes the median of all numeric variables in a vector

## Back to our data.frame example

- Let's see what the structure of our data.frame is:

```
str(Charm_City_Circulator_Ridership)
## 'data.frame': 1146 obs. of 15 variables:
## $ day : Factor w/ 7 levels "Friday","Monday",..: 2 6 7 5 1 3 4 2 6 7 ...
## $ date : Factor w/ 1146 levels "01/01/2011","01/01/2012",..: 31 35 39 43 47 51 55 59 63
## $ orangeBoardings : int 877 777 1203 1194 1645 1457 839 999 1023 1375 ...
## $ orangeAlightings: int 1027 815 1220 1233 1643 1524 938 1000 1047 1416 ...
## $ orangeAverage : num 952 796 1212 1214 1644 ...
## $ purpleBoardings : int NA NA NA NA NA NA NA NA NA NA ...
## $ purpleAlightings: int NA NA NA NA NA NA NA NA NA NA ...
## $ purpleAverage : num NA NA NA NA NA NA NA NA NA NA ...
## $ greenBoardings : int NA NA NA NA NA NA NA NA NA NA ...
## $ greenAlightings : int NA NA NA NA NA NA NA NA NA NA ...
## $ greenAverage : num NA NA NA NA NA NA NA NA NA NA ...
## $ bannerBoardings : int NA NA NA NA NA NA NA NA NA NA ...
## $ bannerAlightings: int NA NA NA NA NA NA NA NA NA NA ...
## $ bannerAverage : num NA NA NA NA NA NA NA NA NA NA ...
## $ daily : num 952 796 1212 1214 1644 ...
```

## Review

- Creating a new script
- Using R as a calculator
- Assigning values to variables
- Performing algebra on numeric variables
