# Writing your own functions

This is a brief introduction. The syntax is:

```
functionName = function(inputs) {  
< function body >  
return(value)  
}
```

Then you would run the 4 lines of the code, which adds it to your workspace.

## Writing your own functions

Here we will write a function that returns the second element of a vector:

```
> return2 = function(x) {  
+   return(x[2])  
+ }  
> return2(c(1,4,5,76))
```

```
[1] 4
```

## Writing your own functions

Note that your function will automatically return the last line of code run:

```
> return2a = function(x) {  
+   x[2]  
+ }  
> return2a(c(1,4,5,76))
```

```
[1] 4
```

And if your function is really one line or evaluation, like here, you do not need the curly brackets, and you can put everything on one line:

```
> return2b = function(x) x[2]  
> return2b(c(1,4,5,76))
```

```
[1] 4
```

## Writing your own functions

Also note that functions can take multiple inputs. Maybe you want users to select which element to extract

```
> return2c = function(x,n) x[n]  
> return2c(c(1,4,5,76), 3)
```

```
[1] 5
```

# Writing a simple function

Let's write a function, `sqdif`, that:

1. takes two numbers `x` and `y` with default values of 2 and 3.
2. takes the difference
3. squares this difference
4. then returns the final value

## Writing a simple function

```
> sqdif <- function(x=2,y=3){  
+   (x-y)^2  
+ }  
>  
> sqdif()
```

```
[1] 1
```

```
> sqdif(x=10,y=5)
```

```
[1] 25
```

```
> sqdif(10,5)
```

```
[1] 25
```

# Writing your own functions

Try to write a function called `top()` that takes a `matrix` or `data.frame`, and returns the first `n` rows and columns, with the default value of `n=5`.

## Writing your own functions

Try to write a function called `top()` that takes a matrix or `data.frame`, and returns the first `n` rows and columns

```
> top = function(mat,n=5) mat[1:n,1:n]
> my.mat = matrix(1:1000,nr=100)
> top(my.mat) #note that we are using the default value for
```

	[,1]	[,2]	[,3]	[,4]	[,5]
[1,]	1	101	201	301	401
[2,]	2	102	202	302	402
[3,]	3	103	203	303	403
[4,]	4	104	204	304	404
[5,]	5	105	205	305	405

## Custom functions in apply

You can use any function you want in apply statements. For example, from our split Circulator data

```
> circ = read.csv("http://www.aejaffe.com/winterR_2016/data/
+               header=TRUE,as.is=TRUE)
> dayList = split(circ, circ$day)
> lapply(dayList, top, n = 2)
```

\$Friday

	day	date
5	Friday	01/15/2010
12	Friday	01/22/2010

\$Monday

	day	date
1	Monday	01/11/2010
8	Monday	01/18/2010

## Custom functions in apply

You can also designate functions “on the fly”

```
> lapply(dayList, function(x) x[1:2,1:2])
```

```
$Friday
```

	day	date
5	Friday	01/15/2010
12	Friday	01/22/2010

```
$Monday
```

	day	date
1	Monday	01/11/2010
8	Monday	01/18/2010

```
$Saturday
```

	day	date
6	Saturday	01/16/2010
13	Saturday	01/23/2010

## Simple apply

sapply() is a user-friendly version and wrapper of lapply by default returning a vector, matrix, or array

```
> sapply(dayList, dim)
```

	Friday	Monday	Saturday	Sunday	Thursday	Tuesday	Wednesday
[1,]	164	164	163	163	164	164	164
[2,]	15	15	15	15	15	15	15

```
> sapply(circ, class)
```

day	date	orangeBoardings	orangeA
"character"	"character"	"integer"	"integer"
orangeAverage	purpleBoardings	purpleAlightings	purpleA
"numeric"	"integer"	"integer"	"integer"
greenBoardings	greenAlightings	greenAverage	bannerB
"integer"	"integer"	"numeric"	"integer"
bannerAlightings	bannerAverage	daily	"integer"

```
> myList = list(a=1:10, b=c(2,4,5), c = c("a","b","c"),  
+             d = factor(c("boy","girl","girl")))  
> tmp = lapply(myList,function(x) x[1])  
> tmp
```

\$a

[1] 1

\$b

[1] 2

\$c

[1] "a"

\$d

[1] boy

Levels: boy girl

```
> sapply(tmp, class)
```

```
> sapply(myList,function(x) x[1])
```

```
  a    b    c    d  
"1" "2" "a" "1"
```

```
> sapply(myList,function(x) as.character(x[1]))
```

```
  a      b      c      d  
"1"    "2"    "a"  "boy"
```
